##  
Overview

This  
is  
the  
mile-  
stone  
re-  
port  
for  
the  
Data  
Sci-  
ence  
Cap-  
stone  
Project.

## Clean and sample the data sets

In order to be able to predict the next word with the highest degree of accuracy, in a reasonably efficient manner, the data set needed to be cleaned up. Numbers, punctuation, special characters, and stop words were removed. In addition, words were converted back to their stems.

The next sections use the `tm` package, you can find an introduction here \* <https://cran.r-project.org/web/packages/tm/vignettes/tm.pdf>

Samples of the data sets are used to reduce the memory footprint.

```

set.seed(90210)

combined_set <- c(blog, news, twitter)
sample_set    <- sample(combined_set, size = 3000, replace = TRUE)

# encode
Encoding(sample_set) <- "latin1"
combined <- iconv(sample_set, "latin1", "ASCII", "")

# create the corpus
swiftkey = Corpus(VectorSource(sample_set))

# clean up objects
#rm(blog, news, twitter, sample_set)

```

Tidy up the data sets by removing elements and converting to a common case.

```

swiftkey <- tm_map(swiftkey, content_transformer(tolower))

# remove the most commonly used words in the english language
swiftkey <- tm_map(swiftkey, removeWords, stopwords("english"))

# reduce inflected (or sometimes derived) words to their word stem
swiftkey <- tm_map(swiftkey, stemDocument)

# clean up
swiftkey <- tm_map(swiftkey, stripWhitespace)
swiftkey <- tm_map(swiftkey, removePunctuation)
swiftkey <- tm_map(swiftkey, removeNumbers)

```

## Basic n-gram models

```

ff <- TermDocumentMatrix(swiftkey)
findFreqTerms(ff, lowfreq=100)

```

```

## [1] "back" "can" "come" "day" "get" "good" "just" "know"
## [9] "like" "look" "love" "make" "need" "new" "now" "one"
## [17] "see" "thank" "think" "time" "want" "will"

```

end with word cloud for fun
